IMPORTANT NOTICE: The World Health Organisation has recommended that pregnant women and new mothers be informed on the benefits and superiority of breastfeeding – in particular the fact that it provides the best nutrition and protection from illness for babies. Mothers should be given guidance on the preparation for, and maintenance of, lactation, with special emphasis on the importance of a well-balanced diet both during pregnancy and after delivery. Unnecessary introduction of partial bottle-feeding or other foods and drinks should be discouraged since it will have a negative effect on breastfeeding. Similarly, mothers should be warned of the difficulty of reversing a decision not to breast-feed. Before advising a mother to use an infant formula, she should be advised of the social and financial implications of her decision: for example, if a baby is exclusively bottle-fed, more than one can (400 g) per week will be needed, so the family circumstances and costs should be kept in mind. Mothers should be reminded that breast milk is not only the best, but also the most economical food for babies. This product must be used under medical supervision. SMA® PRO Anti-Reflux is a special formula intended for the dietary management of bottle-fed babies when significant reflux (regurgitation) is a problem. It is suitable as the sole source of nutrition up to 6 months of age, and in conjunction with solid food up to 12 months of age. If the baby’s reflux does not improve within 2 weeks of starting SMA® PRO Anti-Reflux, or if the baby fails to thrive, the family doctor should be consulted.

SMA® PRO Anti-Reflux

Supporting you to support parents
SMA® PRO Anti-Reflux is specifically designed for the dietary management of reflux and regurgitation. It is nutritionally complete and suitable for use from birth.

Gastro-oesophageal reflux (GOR) affects approximately 40% of infants, but usually resolves by the age of one.¹

In 2015, NICE recommended the following measures for managing formula-fed infants with frequent regurgitation associated with marked distress:¹

1. Offer parental reassurance
2. Review feeding history, suggest smaller more frequent feeds (while maintaining appropriate daily milk volume intakes)
3. Trial of a thickened formula
4. If a thickened formula does not work, stop the thickened formula and offer alginate therapy for a trial period of 1–2 weeks

In infants with vomiting or regurgitation, look out for ‘red flag’ symptoms, such as blood in stool, persistent diarrhoea or abdominal distension which may suggest a more serious condition.¹

Unique combination of easily digestible starch and 100% whey, partially hydrolysed protein.

Available in 800 g cans of powder to purchase in retail. The current formula SMA® Staydown Anti-reflux in 900 g cans is still available on prescription (UK only), or can be ordered via pharmacies.
